

# CAMOUFLAGE CLOAK M-20

## “Invisible warrior”

Camouflage cloak M-20 “Invisible warrior” is intended to increase the camouflage protection of soldiers in conditions when there is no possibility of visual observation of the battlefield, but devices for surveillance and reconnaissance with devices for detecting the thermal reflection of the target are used.

The “invisible warrior” is made of specific materials that provide suppression of thermal reflection by the dispersion of heat emitted by the soldier’s body, which reduces the detectability in the infrared part of the electromagnetic spectrum by surveillance and reconnaissance devices. In addition to reducing the thermal reflection, the M-20 camouflage cloak provides its camouflage pattern and an increase in camouflage protection in the visible part by breaking the body contour with the shape and camouflage characteristics of the material.

The camouflage cloak M-20 provides the smooth implementation of the tasks of all battles in a temperature range of -30°C to +50°C and in day and night conditions.
